

Application for Data Engineer at Walmart

Dear Hiring Team,

I am writing to express my strong interest in the Data Engineer position at Walmart. As a DevOps engineer with hands-on full-stack development experience and a demonstrated track record of building AI-powered solutions, I am excited about the opportunity to help scale Walmart's next generation of AI-driven capabilities.

In my most recent role at Dynamic Advance, I designed and developed an AI module integrated into a corporate ERP system, including an LLM-based agent capable of real-time querying against SQL Server databases. I built the complete backend in .NET with robust encryption for API keys and delivered the full user interface using Next.js with TypeScript. This experience directly aligns with your need for engineers who can build AI-enabled features and agentic workflows while collaborating with product and business teams.

My background as a DevOps engineer complements this role neatly. I specialize in CI/CD pipelines, infrastructure as code with Terraform and Ansible, container orchestration with Kubernetes, and cloud platforms like AWS. This foundation provides me with a strong understanding of distributed systems, containerization, and MLOps practices such as automated deployment, monitoring, and versioning—skills that are essential for bringing predictive models into production reliably and at scale.

I am eager to apply my combined full-stack, AI, and DevOps experience to help Walmart build scalable, secure, and reliable systems. Thank you for your consideration, and I would welcome the opportunity to discuss how my technical background and enthusiasm for AI can contribute to your team.

Sincerely,

Luis Fernando Rodríguez Vargas
